

## Auditable AI /grounded di llc

"Auditable AI" is a concept within artificial intelligence (AI) focusing on transparency and accountability, while Grounded DI LLC is a company that is developing technology for deterministic, auditable AI systems. 

## Auditable AI

Auditable AI refers to the design and implementation of AI systems in a way that allows their operations, decisions, and outcomes to be documented, reviewed, and verified by humans or other systems. The goal is to ensure compliance with legal, ethical, and internal standards, especially in high-stakes applications like finance, healthcare, and risk management. Key aspects include: 

- **Transparency:** Providing a clear, understandable trace of the AI's actions and the data used to make decisions.
- **Traceability:** The ability to track every step and input in the model's development and operation.
- **Compliance:** Adhering to standards and regulations, such as those recommended by the [NTIA](#) or outlined in standards like BS ISO/IEC 42006:2025.
- **Bias Prevention:** Helping to identify and mitigate biases that could lead to legal challenges or damaged reputations. 

## Grounded DI LLC

**Grounded DI LLC** is a company focused on data accuracy and integrity, developing technologies that ensure outputs are consistent and verifiable. Their approach involves "dynamic grounding" and a proprietary system called the "DI<sup>2</sup> Lock Graph" to achieve **deterministic AI**, meaning it produces the same answer every time given the same inputs. This method aims to:

- **Prevent hallucinations:** By forcing the model to use and cite trusted, customer-approved sources, the system reduces the risk of generating false or misleading information.
- **Ensure trust in high-stakes applications:** The consistent and repeatable nature of their AI is highlighted as a way to ensure trust and auditability.
- **Provide stable and repeatable results:** The DI<sup>2</sup> Lock Graph acts as a constraint system that prevents output drift. 

In essence, Grounded DI LLC is an example of an organization actively implementing the principles of auditable and grounded AI to build more reliable and trustworthy systems. 

↳ What are some other companies developing auditable AI?

↳ What are some real-world applications of deterministic AI in finance or treasury risk?

↳ How does Grounded DI's DI<sup>2</sup> Lock Graph ensure AI determinism?
